Goods-In and Receiving Standard

Reference SC-STD-010 · version 1.4 · owner: Head of Supply Chain · effective 15 June 2026

1. Purpose

Receiving errors are the largest single cause of unexplained stock gaps after counting errors. This standard makes sure that what is booked into stock is what physically arrived.

2. Before the delivery

- Check the advance shipping notice (ASN) for the delivery: number of cartons, lines and units.
- Clear the receiving bay. Deliveries are never received into a shop-floor area.
- Deliveries outside opening hours need two colleagues present and are recorded in the alarm log.

3. Receiving

- Scan every carton. Do not book a delivery from the paperwork alone.
- Compare the carton count with the ASN while the driver is present. Note shortages, extras and damage on the delivery note and have the driver sign it.
- Check pack sizes. A carton of 12 booked as 12 cartons (or the reverse) is the most common keying error; check the units, not just the lines.
- The receiving supervisor signs off the delivery in the stock system on the same day.

4. Discrepancies

Discrepancy	Action	Deadline
Short or over delivery	Raise a claim with the distribution centre team	Within 48 hours of delivery
Damaged stock	Photograph, book to reason code DMG, raise a claim	Within 48 hours
Booked and scanned quantities differ by more than 5%	Recount the lines affected	Within 24 hours
Wrong item delivered	Quarantine, do not sell, return with the next collection	Next collection

Claims raised after 48 hours are not accepted by the distribution centre, so the store absorbs the loss.

5. When Sentinel flags a receiving error

Follow the receiving-error SOP. In short: find the delivery, compare the delivery note, the ASN and the goods-in scans, recount the line, and if the delivery was short, raise the claim with the distribution centre or supplier within its window. Record the outcome in Sentinel as a process issue.
